

# Effect of Gibberellic Acid on Tart Cherry

**N.L. Rothwell, K.L. Powers, J.E. Nugent**  
NW MI Horticultural Research Station

# Gibberellic Acid (GA)

- Plant hormone
- Promotes cell division and elongation
- Increases lateral branches

# GA Use in Cherry

- In young tart and sweet cherry:
  - Reduces flowering and fruiting
  - Minimizes polled transmitted virus infection
- In mature tart cherry:
  - We are investigating the potential to increase lateral shoots and spurs
    - Increased branching increases fruiting

# The Balaton Dilemma

- Balaton yields are lower compared to Montmorency
  - Particularly in cool, wet springs
- Tendency to produce blind wood
  - Branches without leaves or blossoms

# Can GA help reduce blind wood and increase fruit set in Balaton?

- Four year study (2005-2008)
- Three rates of GA:
  - 10 ppm, 20 ppm, 30 ppm
- Applied 3-4 wks after full bloom
- Data collected in September
  - Number of shoots with terminal bud on last year's growth

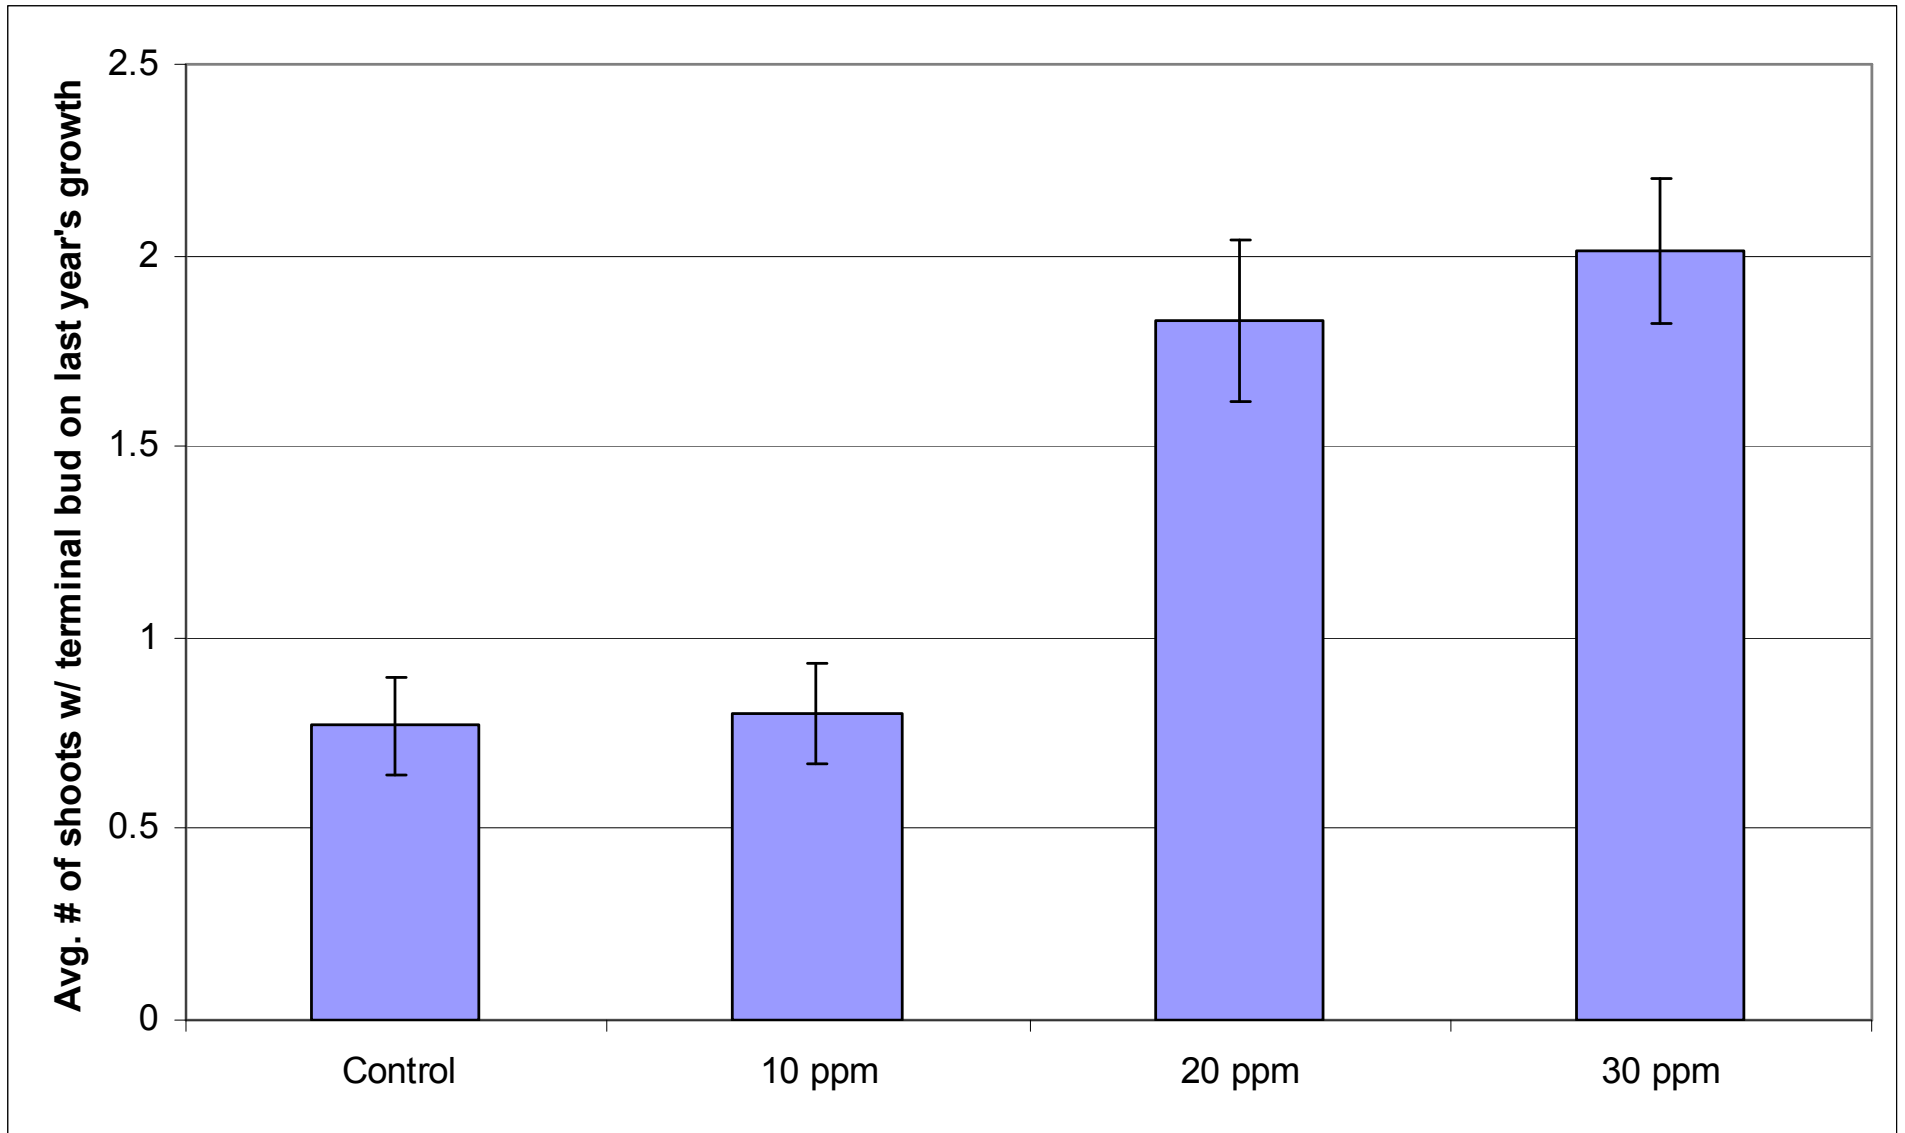

# 2006

2007

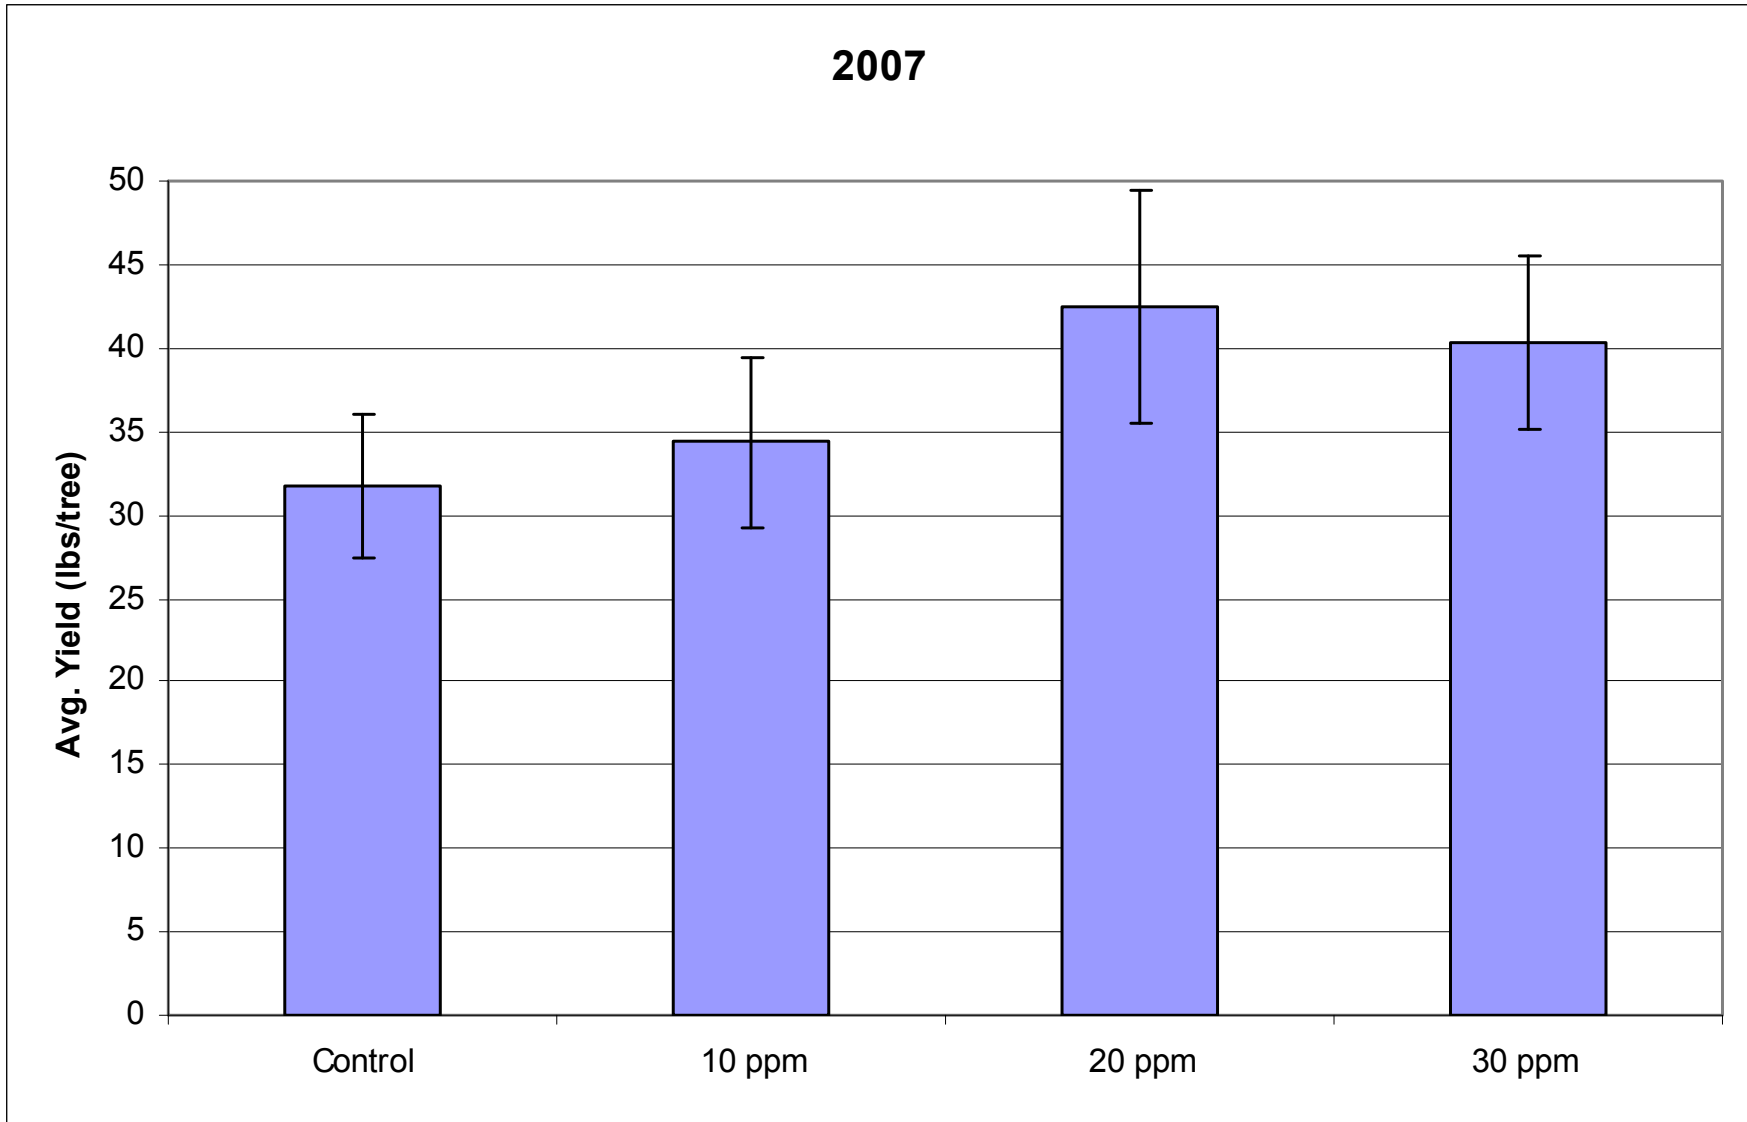

2008

# GA Effect on Yield

# GA Effect on Yield

# GA and Sweet Cherries

- Previous research
  - GA is used regularly on sweet cherries in PNW (and under evaluation in Ontario)
  - Pre-harvest GA spray can be used to improve sweet cherry quality
    - Increases fruit size and firmness

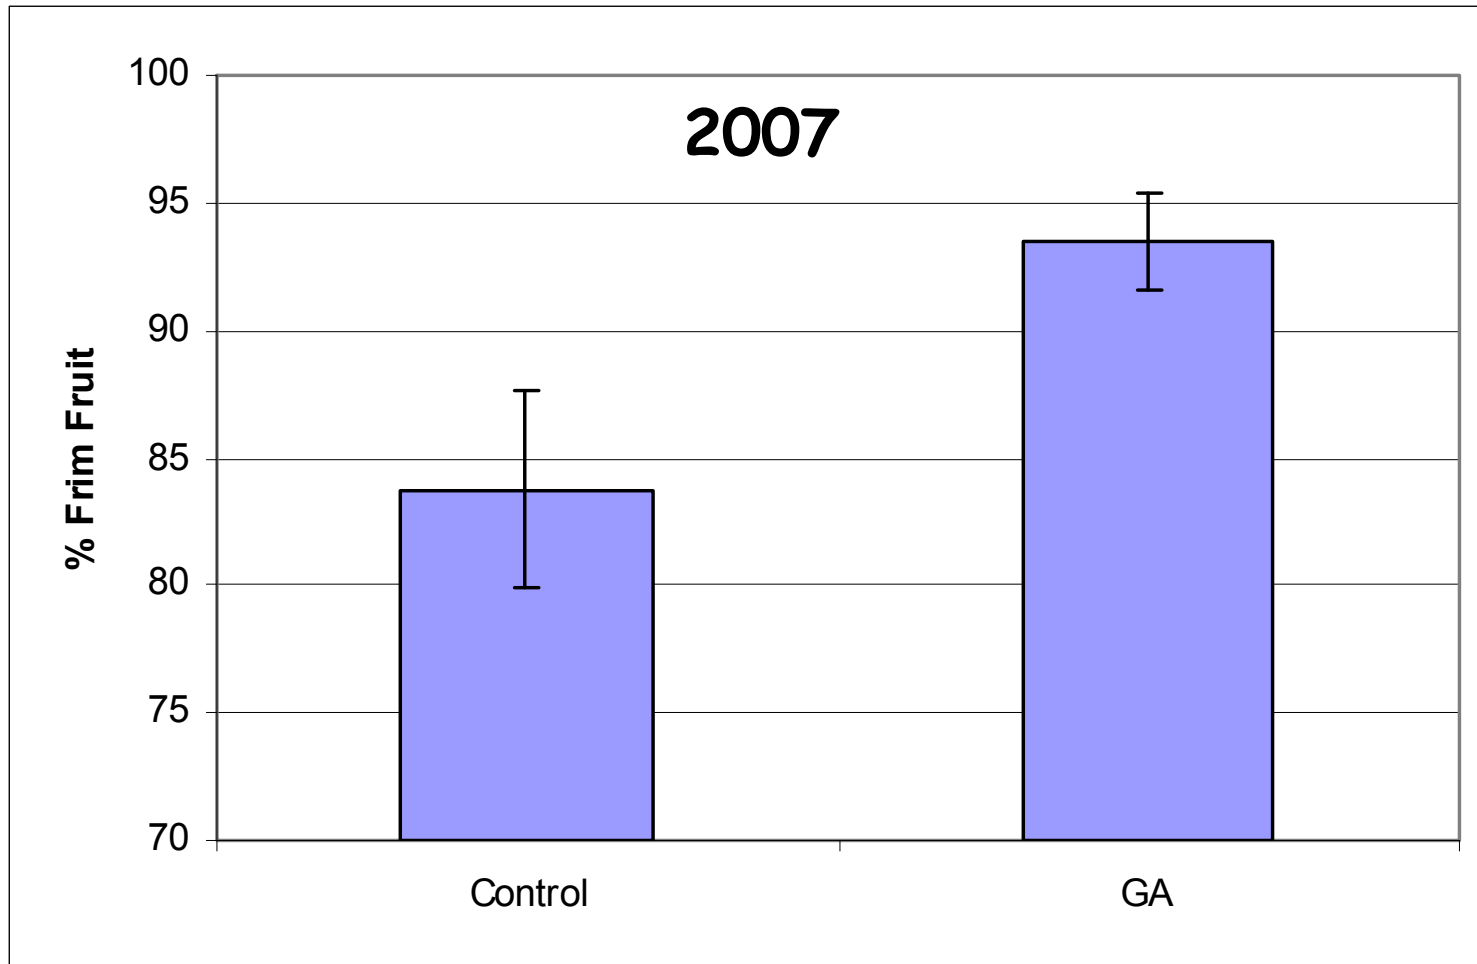

# Can GA Firm Montmorency?

- Collect 100 fruit/tree
- Run cherries through Harvest Simulator
  - Determine % of soft fruit

# NWMHRS Results

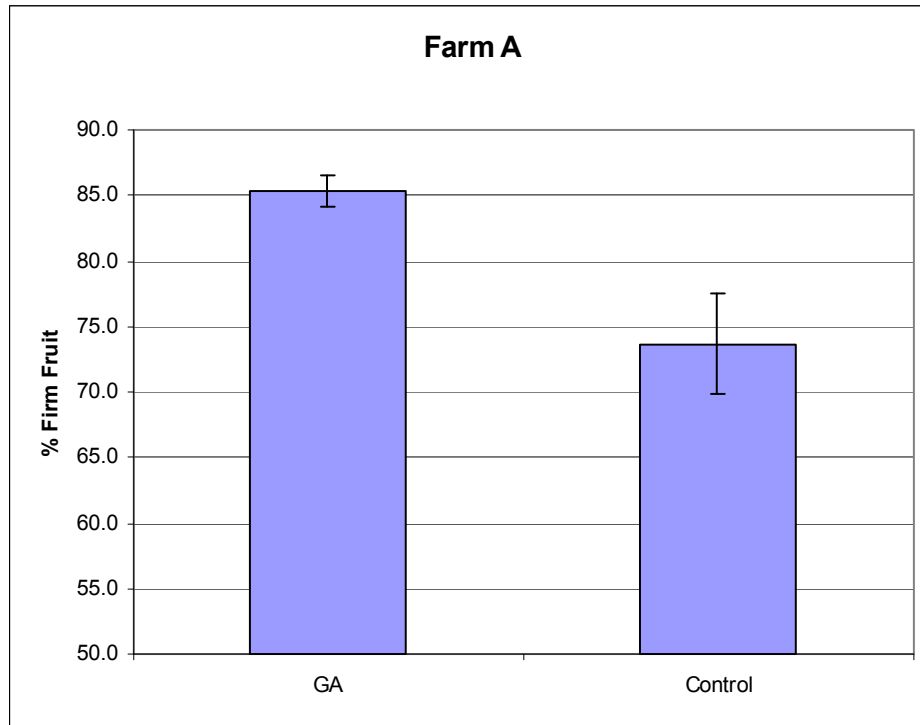

GA applied at 40oz/Acre, on June 28.

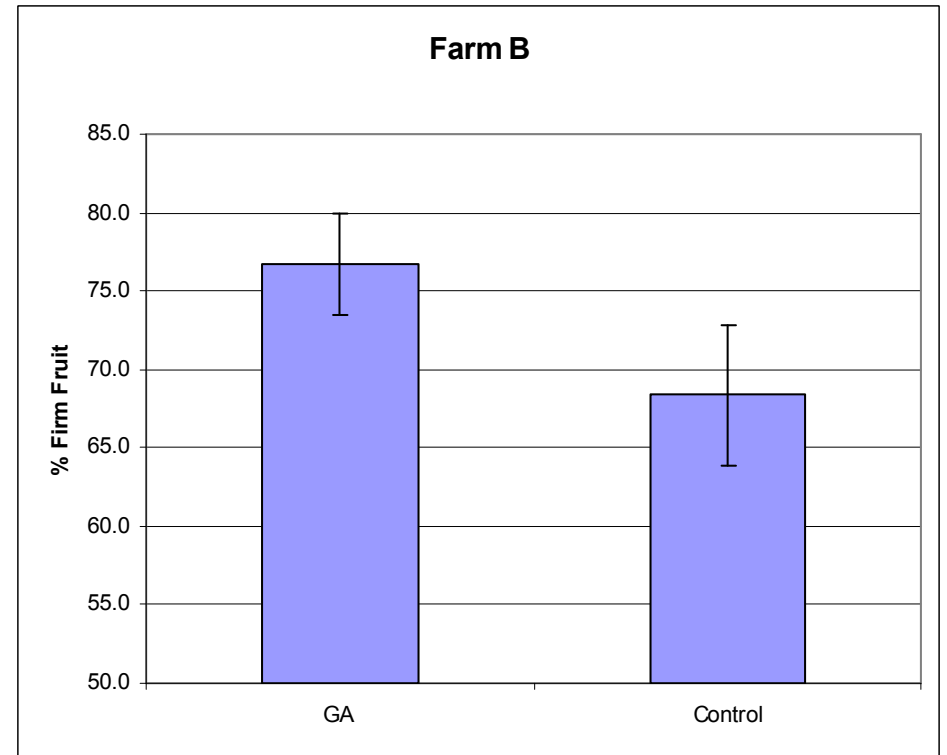

Fruit tested for firmness on July 19.

# On-Farm Results

Antrim Co., 2005

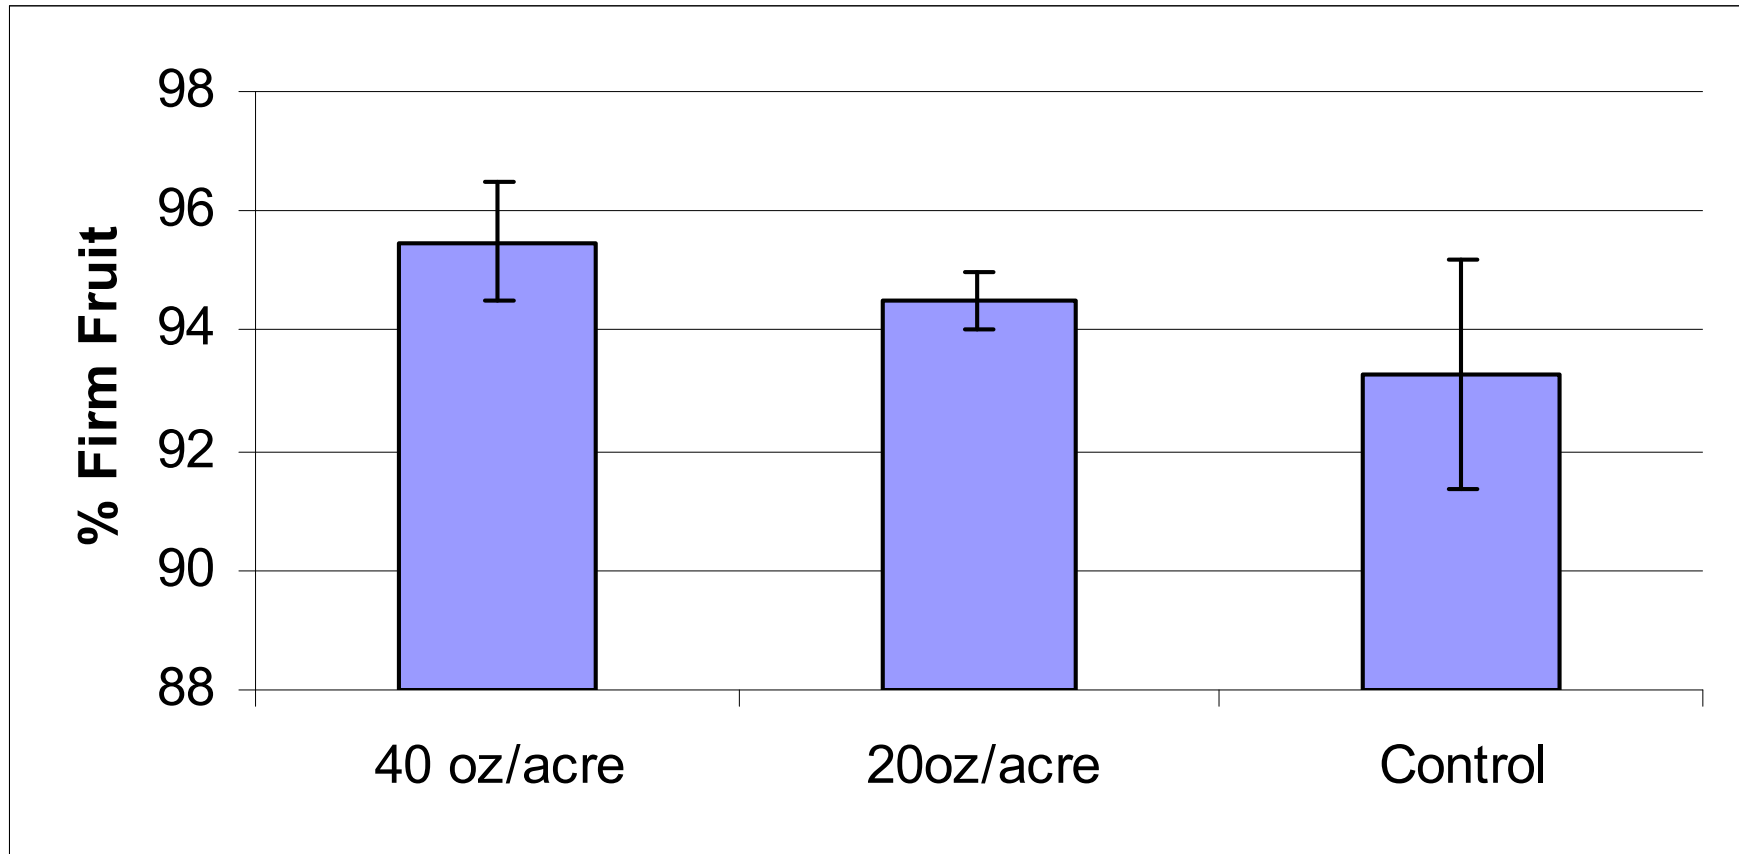

Leelanau Co., 2005

GA applied at 40oz/Acre, ~2 weeks before harvest

# GA Rate to Firm Montmorency

GA applied ~2 weeks before harvest
