

Economics of Weed Control Programs in Corn, 2017

Erin E. Burns, MSU Extension Weed Science

A field trial in corn was conducted in 2017 at the MSU Agronomy Research Farm in East Lansing, MI to compare weed control, corn injury, corn yield, and economic returns of dominant weed control programs marketed to Michigan growers. Each major herbicide company was asked to submit up to four weed control programs for the study based on soil type and weed infestation history. Site characteristics and herbicide application timings are described in Table 1. Table 2 describes the herbicide programs selected by each company for 2017. Herbicide programs are sorted by application timing and the need for glufosinate- (LibertyLink) or glyphosate- (Roundup Ready) resistant corn seed. Corn was planted and PRE herbicide applications were made on May 15. Precipitation at this location is presented in Table 4. Within 14 days after planting and application of the preemergence herbicides the site received 1.19 inches of rain. Twenty-four of the 26 herbicide programs examined resulted in greater than 90% control of all weeds prior to harvest. Twenty-four of the 26 herbicide programs resulted in statistically similar yield. The maximum yield in this trial was 203 bu/A, and yield was 117 bu/A in the untreated (weedy control) treatment. Weed competition in this trial resulted in a yield loss of 86 bu/A (58%). Twenty-four out of 26 herbicide programs resulted in statistically similar gross margins. The maximum gross margin in this trial was \$575.40/A, and the gross margin in the untreated weedy treatment was \$363.48/A. Weed competition in this trial resulting in an economic loss of \$211.92/A (63%). Table 3 contains the data for corn injury, weed control, herbicide program costs, corn yield, and economic returns.

Table 1. Site description and application details

Crop	Corn
Variety	P9807 AM
Row Spacing	30 inches
Soil Texture	Sandy loam
Soil pH	6.1
Soil Organic Matter	2.5%
Dominant Weeds	ANGR, CHEAL, AMAPO, AMBEL, ABUTH
Planting Date	May 15
Application Timing:	
PRE	May 15
EPOS	June 7
POST	June 13
Evaluation Times	Corn injury- 31 d after planting Weed control prior to harvest (31 d after POST)

Abbreviations: ANGR = annual grasses, mainly foxtail species, CHEAL = common lambsquarters, AMAPO = Powell amaranth, AMBEL = common ragweed, ABUTH = velvetleaf

¹Herbicide costs = avg. of price lists; App. cost = \$7.50/A; seeding rate = 33,500 seeds/A. Weed control costs = Herbicide \$ + Additive \$ + Application \$

²Crop selling price = \$3.10/bu (December 2017). Economic return = (Yield x Price) – Weed Control Costs

³*Not statistically different from the highest yielding

⁴**Not statistically different from the highest gross margins

⁵Many herbicide programs have long rotation restrictions to more sensitive crops, i.e., sugarbeet, alfalfa, potatoes, etc. Consult the Table 12 in the MSU Weed Control Guide for Field Crops (E-434) or the herbicide label for crop rotation restriction
